

# InfraForge Infrastructure Review Checklist

A short prep guide for SaaS teams under infrastructure pressure.

- Map the revenue-critical request path (users -> services -> data stores).
- List the top 3 recurring incident patterns and their triggers.
- Capture IaC state risks: drift, shared state, or unsafe applies.
- Note deployment failure modes and rollback reliability.
- Identify top 3 cost drivers and why they spike.
- Document ownership gaps (who owns what in production).
- Collect existing runbooks, on-call notes, and dashboards.

What happens next:

- Reply within 24 hours with a risk map + recovery plan outline.
- Request only read-only access or artifacts needed to validate risk.
- Prioritize fixes that reduce risk in the first 1-2 weeks.
